

Ogwi — Business & Product Overview

Handover Document 1 of 4 · v2.1 (context edition) · August 2026 *All rules in this set are identical to v2.0 (owner-ratified). This edition adds narrative structure and context only — nothing normative was removed or changed.*

How to read this document set

Four documents, one product, one reading spine:

Document 1 (this one) is the meaning. It tells you what world Ogwi lives in, what problem it solves, how it feels to use, how it thinks, and how the machine hangs together — in plain language, before any rules. Read it end to end first, whoever you are.

Document 2 is the law. Every surface, every system, every number. It is the sole build authority; anything not in it is not specified. It opens with the learner-visible world (Part A), bridges into the twelve underlying systems in plain language, then specifies them in full (Part B), pins the architecture and governance (Part C), and lists the few genuinely open decisions (Part D).

Document 3 is the map. The same law, arranged for speed: glossary, data-flow diagram, event model, config registry, publish points, invariants, sources of truth, and the build-order checklist. It is deliberately non-authoritative — when it and Document 2 differ, Document 2 wins.

Document 4 is the fence. Everything that was considered and deliberately rejected, with reasons — so a good idea that already lost to a better principle doesn't return through someone acting in good faith.

Suggested first-day paths. Developer: this document → Document 2's Part A → the Bridge → Part B → Part C → Document 3 §8 (the build order). Product manager: this document → Document 2 Part A → Document 4. Designer: this document → Document 2 A1–A14 → Document 4's interface boundaries. QA: this document §5 → Document 2's per-system acceptance blocks → Document 3 §6.

1. The problem Ogwi exists to solve

Picture the customer before the product. Someone in their late twenties to forties, employed full-time, often with a family, who has decided to change careers — into IT, project management, finance. Between them and that new career stands a professional qualification: a real exam, set by a real awarding body, with a real pass mark. They will pay for it themselves, and they will study for it in the gaps of an already full life — twenty minutes on a commute, an hour after the kids are down.

The tools available to them are built for someone else. Traditional courses assume time they don't have. Video libraries let them *watch* for forty hours and feel productive while retaining little — because watching isn't learning; retrieving is. And the consumer learning apps that *do* understand habit and motivation are built around streaks — mechanics that punish exactly the life this person leads, where a sick child or a work crisis breaks a 40-day chain and, with it, the will to continue.

Meanwhile, two bodies of knowledge exist that almost never meet in one product: **learning science** (retrieval practice, spaced repetition, mastery measurement, cognitive-load management — decades of evidence about what actually gets people through exams) and **game design** (what makes people come back tomorrow, voluntarily, and enjoy it). Ogwi is the deliberate combination of the two, aimed squarely at this one person.

The founding line (approved for marketing): *"We took everything science knows about learning and everything games know about fun, and we built an app to get you qualified."*

2. What Ogwi is

Ogwi is a consumer learning platform that gets career changers through the professional qualifications standing between them and their next career. It combines what learning science knows about passing exams — retrieval practice, spaced repetition, mastery measurement, careful control of cognitive load — with what games know about motivation, compressed into short, personalised daily sessions of **10–15 minutes** that fit around a full-time job, a family and a real life.

The product is fronted by **Oggi**, an inflatable AI study buddy available by chat or voice who explains, quizzes, coaches — and, in the platform's most distinctive move, gets *taught by* the learner (explaining something to a genuinely confused student is one of the strongest learning acts there is; Ogwi turns it into a measured feature). Progress is dramatised by the **Flight System**: study pumps helium into Oggi, helium leaks because that is what helium does, and Oggi's altitude over a parallax city is the learner's status. There is exactly one motivation system — helium, measured in litres — and no XP, no streaks, and no hours tracking anywhere in the product. The flight metaphor is not decoration: it is the streak problem *solved*. A streak is binary and dies; altitude is continuous and drifts. Miss two days and you're lower, not broken — and one ordinary session climbs you back.

Naming rule. Ogwi is the company and platform; Oggi is the mascot and AI study buddy, and the only spelling. The teaching feature is *Teach Oggi*.

True North: *Make trusted career qualifications accessible and achievable for everyone.*

Tagline: *"Going up."*

3. Who it serves, and the scope boundary

The customer is the self-funded career changer — someone who needs credible proof of ability to enter a new industry without quitting the job they already have. This is the only audience Ogwi names, in product and in marketing.

Scope boundary: Ogwi teaches the syllabus and prepares learners for the exam. Exam entry and certification remain entirely with third-party awarding bodies (AAT, ACCA, CompTIA, PMP and similar). Ogwi never sets, stores or asks for exam dates. This boundary shapes more of the product than it first appears: because Ogwi never knows the exam date, nothing in the product can ever be a countdown — and everything about readiness had to be built as an honest, always-current answer rather than a deadline tracker.

4. The learner's experience

Day one. The front door is open: browse careers, see which qualifications each requires, pick one. Onboarding is jargon-free (a plain-language primer and an in-product glossary carry new vocabulary), there is no placement test and no target-setting step — the qualification's real pass mark is everyone's bar — and the first session begins immediately. The free trial requires no card and ends when the first session is completed. The design standard for that first session: the learner should finish thinking *"I'm in good hands."*

The daily loop. Each day the learner opens the app to Oggi floating at his current altitude, taps into the next topic, and enters the Flow — a full-screen, distraction-free shell. Every session opens with one to two minutes of quick review questions on earlier material (retrieval first, always), then moves through the topic's mix of short theory pages, quizzes, and active exercises — blurting (say everything you remember), teaching Oggi, or a module-end debrief — in an order that deliberately stays unpredictable, so the rhythm never goes stale. Sessions end with a count-up of the helium earned and Oggi climbing. Wrong answers are never punished: every mistake gets an explanation, returns later asked a different way, and "not yet" is the only failure state in the product.

The week and the milestones. Missed days cost nothing but altitude — Oggi drifts lower and waits patiently on the ground if the helium runs out; one ordinary session relaunches him. Earlier material returns automatically just before it would be forgotten, labelled honestly ("Keeping fresh"), and weak spots return as targeted fix-up quizzes ("Fixing gaps"). Awards land for altitude, flight length, big days, comebacks and — hardest of all — sustained rhythm. The Progress page shows completion, an expected finish date ("at your current pace"), a mastery picture per module against the pass mark, and — once earned through a short visible checklist — the headline number: **the odds of passing**, stated with how certain it is and the single next action that most improves it.

The pass. When the calibrated odds first climb past 80%, the product says so once, plainly: *"You'd very likely pass if you sat it soon."* After the real exam, the learner's journey becomes an editable **Arrival Story** card — days, flights, comebacks, the credential — and sharing it is what earns referral rewards: proof, not promises.

5. How the product thinks — the principles, with their reasons

Every rule in Document 2 descends from a small set of convictions. Understanding them makes the thousand details cohere; here they are with their reasoning, then stated as the principles themselves.

Why honesty is structural: the product's central promise is a checkable one — published pass rates, readiness stated as odds that either calibrate against reality or don't. That promise dies

the first time a number flatters. So the display layer may be gentle about *when* it shows a decline, but no engine and no prediction ever reads a softened value. *Why kindness lives in display, never in the model*: softening the model rebuilds the illusion-of-mastery problem the product exists to kill; softening the display's timing hurts no one. *Why forgiveness is mechanical, not copywritten*: a warm message over a punishing mechanic is a lie; here the mechanics themselves forgive — nothing expires, comebacks strengthen memory, corrections to flight history can only lengthen flights. *Why one currency*: research on stacked gamification (badges plus leaderboards plus coins) shows it eroding motivation; a single currency tied to genuine learning cannot be gamed against itself.

Honesty of numbers. One linear scale everywhere (1 litre = 1 foot); exact figures, never rounded bands (one scoped exception exists: the Orbit display state — Document 2, B9); altitude reflects current pace, never banked history; mastery and readiness are computed from what the learner can actually retrieve, and no prediction shown to a learner is ever computed from a softened display value.

Kindness of framing. Decline is discovered, never watched, narrated or shamed; empty days are simply empty; there are no countdowns, deadlines, overdue counts or red states; "due for a refresh" is the only decay language; every attempt receives goal → what happened → next step; feedback targets effort and strategy, never the person.

Forgiveness by construction. Nothing expires, nothing resets, nothing is a deadline; the way back from an ended flight is never more than one honest session; comebacks make memory stronger, not weaker; touchdown closes a story, it never erases one; corrections to flight history can only ever lengthen a flight.

One motivation system. Helium is earned by learning only — never sold, gifted, granted by ads or logins, or wagered; maintaining knowledge pays more per answer than meeting it; encouragement from other people never buys altitude; long-term progression rewards are cosmetic only.

Learner sovereignty. System-directed by default (a clear next step, no daily decisions required), autonomy at the edges (free browsing, a full custom test builder, learner-chosen practice activities, learner-invoked timers); every disclosure to another human is chosen, previewable and revocable; mock scores, mastery and readiness are private by default; Oggi chats are private, his memory is inspectable and editable, and nothing sensitive can be stored.

Assessment integrity. Exam mode contains no aids of any kind; readiness never flatters; every learner-facing piece of content is human-approved before going live.

Brand non-negotiables. Convenience and a distinctive Ogwi identity, alongside the founding commitments: celebrating small wins, and full flexibility around jobs, families and real life. Three further cross-cutting laws bind every surface: **no soft-locks** — every AI activity can be ended or skipped, and ending pays out what was earned; **the explain-why rule** — wherever good pedagogy feels bad (spacing, interleaving, no instant retry), one plain line says why; and **the asking earns its keep** — any data the product requests from the learner visibly shapes the next session.

6. A guided tour of the machine

Beneath the surfaces sit twelve systems. Document 2 specifies each in full; here is what each one *is*, in a sentence or three, so the specification reads as a story you already know. (The Bridge section inside Document 2 retells this at the next level of depth, including the journey of a single answer through all twelve.)

The content graph (B10) is the factory and the single source of truth: one versioned structure holding every module, topic, objective, question, marking point and lesson page — and nothing reaches a learner without passing its human review gate. **The spaced engine (B4)** is the memory keeper: every fact the learner has ever correctly retrieved carries its own forgetting curve, and the engine brings material back just before it would slip — never punishing lateness, because a late successful review strengthens memory *more*. **Mastery (B1)** is the honest scoreboard built on those same memory states, weighted exactly as the exam weighs its modules, with a display that is kind about bad days but never lies upward into anything that predicts. **The adaptive engine (B3)** is the repair shop: every miss becomes a comeback that must be proven twice, on different renderings, on different days. **Session composition (B5)** is the choreographer — it decides what today looks like so the learner never has to, and keeps the rhythm deliberately unpredictable. **Blurt scoring (B6)** and **Teach Oggi (B7)** are one fair marker wearing two costumes: a fixed set of human-reviewed key points against which free recall and free explanation are matched — so two learners saying the same thing always score the same, and "what Oggi understands" is literally a data structure. **The litre economy (B8)** is the price list: one currency, priced so that maintaining memory outearns meeting it and grinding pays almost nothing. **Flight physics (B9)** is a pure mathematical function for altitude plus an append-only diary for history — no background jobs, no stored displays, and a correction rule under which late-arriving evidence can only ever *extend* a flight. **Readiness (B2)** converts all of it into the odds of passing — a probability that is checkable against real results, which is the whole point. **Oggi's underlying systems (B11)** are his brain-stem: exactly what he is given, exactly what he remembers, exactly what he may say. And **the connection map (B12, with Document 2's Part C)** is the glue — the award semantics, the canonical data-flow diagram, and the twelve invariants that block any release that violates the philosophy.

7. Business model and goals

Pricing: \$39/month, billed monthly, cancel anytime, fully self-serve. Trial ends at the first completed session. Cancellation is two screens with no guilt copy; **"Hold my balloon"** pauses billing while preserving all progress. The support desk's reply-time promise is published on the pricing page.

Headline KPI: first-time pass rate per qualification, published against national averages. **Health metrics:** return within 7 days after a flight ends (the north-star forgiveness metric), renewal, and readiness calibration — because readiness is a probability, its accuracy is checkable: of learners who sat the exam at ~85% odds, did roughly nine in ten pass (via self-reported results)? **Never measured or displayed:** hours watched, videos completed, login counts, attempt counts. **Also tracked:** programme completion rate; launch A/B experiments and the onboarding pulse experiment, with experiment assignment and version logged on every event they touch.

Cost structure: near-zero marginal human cost per learner (a small reactive support desk; no tutors, mentors, coaches or cohorts). The main variable cost is AI inference — Teach Oggi is the most expensive session type, and that cost buys the differentiation. The largest launch cost is the calibrated content bank; syllabus updates are a scheduled maintenance tax handled through content versioning.

Growth loops: the Wingman digest (one-to-one virality to the people watching a loved one succeed), the Arrival Story (the broadcast moment, rewarded because the achievement is verifiable), and a capped, fraud-checked give-get referral scheme. Marketing operations also include the **counter-voice story programme** — real qualification-holders' career-change stories, later fed by Arrival Story consent — and **identity-conferral language** throughout copy ("network-engineer-in-training", "future project manager"). Marketing statistics of any kind must pass a source check against a credible reference before publication.

First vertical: chosen against four criteria — a large self-funded candidate population; an objective exam format that automated marking can mirror; a stable published syllabus blueprint; a clear career payoff. Entry-level IT, project-management and financial-services qualifications are the candidate pool (final selection: see Open Decisions in Document 2). Multi-qualification journeys are deferred until the first published pass rate exists.

8. Major user journeys

Onboarding — first liftoff. Browse — pick a qualification — first session — its earnings pump the first helium at the first exit or completion beat (every exit pumps); any ordinarily productive session that starts from the ground and completes its topic reaches liftoff (only a near-total-failure sitting falls short, landing with the takeoff gauge nearly full — one opener from the sky). Switching qualification early is free and framed as navigation — "new destination, same balloon": flight records and helium persist; mastery is per-qualification.

The daily session. Open — Oggi's one-line greeting (at most an invitation, never a demand) — the review opener — the topic flow — the completion ceremony — out. Ten to fifteen minutes, every exit banks everything earned.

The comeback. After any gap, the learner returns to an honest, lower altitude (or a patient Oggi on the ground), no backlog count, no guilt — just today's session, with review batches quietly queued over the following days.

The mock and the readiness climb. A three-item checklist (first topic · questions across two modules · one 10-minute mini-mock) unlocks the odds of passing; full Exam Simulations generate a fresh randomised paper each time; the first full mock arrives by invitation, framed as a gap-finder; a rough mock is met with a normalising script and the two highest-leverage fixes.

The Wingman. The learner invites a chosen person (or several, each independent) who receives a positive-only weekly digest and can send encouragement; every field the Wingman sees is toggled by the learner; quiet weeks produce one honest, guilt-free sentence.

Pause and leave. "Hold my balloon" freezes billing and preserves everything; cancellation is two respectful screens; returning restores progress, mastery history, records and connections

— the live altitude is recalculated honestly from rolling time, because the physics never pause for anyone.

9. How the product creates value

For the learner: a credible qualification achieved around a real life, with visible, honest progress and a companion that makes lonely self-study feel accompanied. For the business: a differentiated product (Teach Oggi, the Flight System, calibrated readiness) whose central claims are verifiable — published pass rates and checkable readiness accuracy — creating a trust asset competitors cannot copy with marketing spend; unit economics that improve with scale because the expensive asset (the content graph) is built once per qualification; and growth loops fuelled by real outcomes rather than acquisition budget.

10. Where to go next

You now hold the meaning: the person, the problem, the bet, the feel, the philosophy, and the shape of the machine. Document 2 turns all of it into law — its Part A will read as the world you just toured, its Bridge will retell §6 at working depth, and its Part B will feel like meeting twelve colleagues you've already been introduced to. Document 3 is your desk reference while building. Document 4 is what keeps the product itself as you change it. And when something isn't specified anywhere: it isn't decided — raise it, never invent it.
